To do that, you need numerical superiority, a situation called a "sumito." In that situation, a player's column faces a lesser number of the opponent's marbles, giving him or her advantage. A player can then use a column of three black or white marbles to push one or two of the opponent's marbles one space, or a column of two to push one of an opponent's marbles back a space. Pushing is not a required move. If players have an equal number of pieces confronting each other, a pac is formed. The person with a black marble is first. But Abalone can also be devilishly complex, as we'll explain in the next section. Basically, all it takes is a hexagonal (six-sided) board with 61 circular spaces, and 28 marbles, half in black and half in white [source: [url=" 'Abalone/[url]]. Rules To move: A player may move either one, two or three pieces in any of the six directions as long as the space he or she is moving to is empty. Lalet and Levi decided to help the bored youth, and so the idea of Abalone was conceived. The sidestep move is also known as a "broadside" [source: Boardability.com].Essentially, you win the game by pushing the other player's marbles back, sending them to unoccupied spaces and eventually off the board completely to the rim, where they're no longer in play. The trick, though, is that a single marble can't push an opponent's marble. In this situation, pushing is not allowed. StrategiesSafety In Numbers: Keep your marbles in one group. Levi and Lalet tried to get publishers back their game. If the opponent has a column of three marbles, it can't be pushed at all, even if a player has four marbles in a row [source: Abalone].That's pretty much it, except for local variations that players may come up with on their own.
